22 19. A method for reducing crosstalk among a plurality of signals from a plurality of
23 sources, each signal being assigned to a separate channel and primarily containing information
24 corresponding to a different source among the plurality of sources, comprising the steps of:

25 (a) applying spatial corrections to correct any misalignment of the signals between
26 channels, such that corresponding signals from different sources in the plurality of channels are
27 aligned; and

28 (b) for each channel, substantially reducing erroneous contributions to the signal
29 assigned to the channel from others of the plurality of signals.

30 ///

1 20. The method of Claim 19, wherein the step of applying spatial corrections to correct
2 any misalignment of the signals between channels comprises the step of applying spatial corrections
3 at a sub-pixel resolution.

1 47. A method for correcting errors in a multichannel imaging system, wherein each
2 channel has signal information relating to an image of an object, comprising the steps of:

- 3 (a) focusing light from the object along a collection path;
- 4 (b) dispersing the light that is traveling along the collection path into a plurality of
- 5 light beams, such that each light beam corresponds to a different source on the object;
- 6 (c) focusing each of the light beams to produce respective images for the light
- 7 beams;
- 8 (d) providing at least one detector disposed to receive the respective images and in
- 9 response, generating an output signal corresponding to each image;
- 10 (e) correcting misalignment of the images on said at least one detector to within
- 11 sub-pixel resolution, so that all of the output signals are substantially aligned in time; and
- 12 (f) substantially reducing crosstalk contributions to each output signal from other
- 13 output signals.

14 48. A method for correcting errors in a multichannel imaging system, wherein each
15 channel is intended to contain signal information relating to an image of an object, comprising the
16 steps of:

- 17 (a) focusing light from the object along a collection path;
- 18 (b) dispersing the light that is traveling along the collection path into a plurality of light
- 19 beams, such that each light beam corresponds to a different source;
- 20 (c) focusing each of the light beams to produce respective images for the light beams;
- 21 (d) providing at least one detector disposed to receive the respective images and in
- 22 response, generating an output signal corresponding to each image;
- 23 (e) correcting misalignment of the images on said at least one detector, so that all of the
- 24 output signals are substantially aligned in time; and
- 25 (f) substantially reducing crosstalk contributions to each output signal from other output
- 26 signals.

27 49. The method of Claim 48, wherein the step of correcting misalignment comprises the
28 steps of:

- 29 (a) determining a spatial offset between an image currently being processed and a
- 30 reference image; and

1 (b) applying a correction factor to the output signal of the image currently being processed
2 to substantially eliminate the spatial offset.

3 50. The method of Claim 49, wherein the step of applying a correction factor so as to
4 substantially eliminate the spatial offset comprises the steps of:

5 (a) spatially adjusting image data in the output signal so that the image data in the output
6 signal is aligned with the reference image data to the nearest pixel; and

7 (b) reconstructing the output signal by interpolating a remainder of the spatial offset to a
8 fraction of a pixel, to further reduce the spatial offset in the output signal for the image currently
9 being processed.

10 51. The method of Claim 48, wherein the step of substantially reducing crosstalk
11 contributions to the output signal comprises the step of solving a set of linear equations, wherein each
12 output signal is represented by a linear equation.

13 52. The method of Claim 51, wherein the step of solving a set of linear equations
14 comprises the step of solving the set of linear equations for each pixel in the image that produces the
15 output signal.

16 53. The method of Claim 52, wherein the step of solving a set of linear equations
17 comprises the step of applying a singular value decomposition to a matrix form of the set of linear
18 equations.

19 54. A multichannel imaging system for generating an ensemble of images from an object
20 for each field of view of the object, wherein each image in the ensemble contains information from
21 substantially only one source, comprising:

22 (a) a collection lens disposed so that light traveling from the object passes through
23 the collection lens and travels along a collection path;

24 (b) a dispersing component disposed in the collection path so as to receive the light
25 that has passed through the collection lens, dispersing the light into a plurality of light beams, each light
26 beam being directed away from the dispersing component in a different predetermined direction;

27 (c) an imaging lens disposed to receive the light beams from the dispersing
28 component, thereby producing said ensemble of images, each image being produced from a different
29 one of the light beams and being projected by the imaging lens toward a different predetermined
30 location;

1 (d) a multichannel detector disposed to receive the plurality of images produced by
2 the imaging lens, the multichannel detector producing a plurality of output signals, such that a
3 separate output signal is produced for each of said light beams; and

4 (e) means for processing the output signals to:

5 (i) correct the output signals for any misalignment between the images in
6 the ensemble on the multichannel detector to within sub-pixel resolution; and

7 (ii) reduce contributions from the output signals of other channels, to the
8 output signal in each channel.

9 55. A multichannel imaging system for generating an ensemble of images from an object
10 having a plurality of field of views, for each field of view of the object, wherein each image in the
11 ensemble contains information from substantially only one source, comprising:

12 (a) a collection lens disposed so that light traveling from the object passes through
13 the collection lens and travels along a collection path;

14 (b) a dispersing component disposed in the collection path so as to receive the
15 light that has passed through the collection lens, dispersing the light into a plurality of light beams,
16 each light beam being directed away from the dispersing component in a different predetermined
17 direction;

18 (c) an imaging lens disposed to receive the light beams from the dispersing
19 component, thereby producing said ensemble of images, each image being produced from a different
20 one of the light beams and being projected by the imaging lens toward a different predetermined
21 location;

22 (d) a multichannel detector disposed to receive the plurality of images produced by
23 the imaging lens, the multichannel detector producing a plurality of output signals, such that a
24 separate output signal is produced for each of said light beams; and

25 (e) means for processing the output signals to:

26 (i) correct the output signals for any misalignment between the images in
27 the ensemble on the multichannel detector; and

28 (ii) reduce contributions from the output signals of other channels, to the
29 output signal in each channel.

30 ///

1 56. The system of Claim 55, further comprising a display electrically coupled to said
2 means for processing, said display producing an image in response to the output signal as processed
3 by said means for processing.

4
5 57. The system of Claim 55, wherein said means for processing comprises:

6 (a) a memory in which a plurality of machine instructions defining a signal
7 conditioning function are stored; and

8 (b) a processor that is coupled to the memory to access the machine instructions,
9 said processor executing said machine instructions and thereby implementing a plurality of functions,
10 including:

11 (i) processing the output signals to spatially align the images detected by
12 the multichannel detector; and

13 (ii) applying a spectral crosstalk correction to the output signals, to remove
14 a channel-to-channel crosstalk.

15 58. The system of Claim 55, wherein said multichannel detector comprises a time delay
16 integration (TDI) detector, said TDI detector producing said output signals by integrating light from
17 at least a portion of the object over time, while a relative movement between the object and the
18 imaging system occurs.

19 59. A multichannel imaging system for generating an ensemble of images of an object,
20 wherein each image in the ensemble contains information from substantially only a single source
21 from among a plurality of sources, comprising:

22 (a) a first collection lens disposed so that light from the object passes through the
23 first collection lens and travels along a first collection path;

24 (b) a first light dispersing element disposed in the first collection path so as to
25 disperse the light that has passed through the first collection lens, producing a first source from
26 among said plurality of sources;

27 (c) a first imaging lens disposed to receive light from the first source, producing a
28 first image from the first source, said first image being a first one of said ensemble of images;

29 (d) a first detector disposed to receive said first image produced by the first
30 imaging lens, and in response thereto, producing a first output signal;

1 (e) a second collection lens disposed so that light from the object passes through
2 the second collection lens and travels along a second collection path different than the first collection
3 path;

4 (f) a second light dispersing element disposed in the second collection path so as
5 to disperse the light that has passed through the second collection lens, producing a second source
6 from among said plurality of sources;

7 (g) a second imaging lens disposed to receive light from the second source,
8 producing a second image from the second source, said second image comprising a second one of
9 said ensemble of images;

10 (h) a second detector disposed to receive said second image produced by the
11 second imaging lens, producing a second output signal; and

12 (i) means coupled to each detector, for processing the first and the second output
13 signals to perform the following functions:

14 (i) correcting the output signals for misalignment between the images on
15 the first and the second detector; and

16 (ii) substantially reducing contributions to each of the first and the second
17 output signals from the other of the first and the second output signals.

18 60. The system of Claim 59, further comprising a display electrically coupled to said
19 means for processing, said display reproducing an image in response to each output signal as
20 processed by said means for processing.

21 61. The system of Claim 59, wherein said means processing comprises an oscilloscope.

22 62. The system of Claim 59, wherein said means for processing comprises a programmed
23 computer.

24 63. The system of Claim 59, wherein said means for processing comprises an application
25 specific integrated circuit.

26 64. The system of Claim 59, wherein each detector comprises a pixilated detector.

27 65. A multichannel imaging system for generating an ensemble of images of an object,
28 wherein each image in the ensemble contains information from substantially only a single source
29 from among a plurality of sources, comprising:
30

1 (a) a collection lens disposed so that light traveling from the object passes through
2 the collection lens and is focussed along a collection path;

3 (b) a dispersing component that receives the light from the collection lens and
4 disperses the light into a plurality of light beams, as a function of a plurality of different
5 discriminable characteristics of the light, each of said plurality of light beams corresponding to a
6 different one of said plurality of sources;

7 (c) at least one pixilated detector;

8 (d) an imaging lens that focuses each of the plurality of light beams on said at least
9 one pixilated detector, producing a respective image corresponding to a different one of the plurality
10 of light beams, each image being one of said ensemble of images, said at least one pixilated detector
11 providing an output signal for each respective image; and

12 (e) a signal processor coupled to receive the output signals from said at least one
13 pixilated detector, said signal processor processing the output signals to:

14 (i) correct the output signals for any misalignment between the respective
15 images on said at least one pixilated detector; and

16 (ii) substantially reducing crosstalk between the output signals.

17 66. The system of Claim 65, wherein said pixilated detector comprises a time delay
18 integration (TDI) detector, said TDI detector produces said output signals by integrating light from at
19 least a portion of the object over time, while a relative movement between the object and the imaging
20 system occurs.

21 67. The system of Claim 65, wherein said signal processor comprises an oscilloscope.

22 68. The system of Claim 65, wherein said signal processor comprises a programmed
23 computer.

24 69. The system of Claim 65, wherein said signal processor comprises an application
25 specific integrated circuit.

26 70. An article of manufacture adapted for use with a computer, comprising:

27 (a) a memory medium; and

28 (b) a plurality of machine instructions, which are stored on the memory medium,
29 said plurality of machine instructions when executed by a computer, causing the computer to:
30

1 (i) correct a signal misalignment between a set of related signals to within
2 sub-pixel resolution, wherein each one of the set of related signals primarily contains information
3 corresponding to a different specific source; and

4 (ii) substantially reduce crosstalk contributions to each of the signals from
5 other of the signals in the set of related signals.

6 71. An article of manufacture adapted for use with a processor, comprising:

7 (a) a memory medium; and

8 (b) a plurality of machine instructions, which are stored on the memory medium,
9 said plurality of machine instructions when executed by a processor, causing the processor to:

10 (i) correct a signal misalignment between a set of related signals, wherein
11 each one of the set of related signals primarily contains information corresponding to a different
12 specific source; and

13 (ii) substantially reduce crosstalk contributions to each of the signals from
14 other of the signals in the set of related signals.

15 72. A system for reducing crosstalk among a plurality of related signals in a set, each one
16 of the set of related signals primarily containing information corresponding to a specific different
17 source from among a plurality of different sources, comprising:

18 (a) a memory in which a plurality of machine instructions defining the parent
19 application are stored; and

20 (b) a processor that is coupled to the memory to access the machine instructions,
21 said processor executing said machine instructions and thereby implementing a plurality of functions,
22 including:

23 (i) correcting a signal misalignment between the plurality of related
24 signals, each one of the plurality of related signals in the set is substantially aligned with other of the
25 plurality of related signals in the set; and

26 (ii) for each one of the plurality of related signals in the set, reducing
27 crosstalk contributions from other of the plurality of related signals.

1 The above amendment is submitted to add the required Related Applications section to and
2 cancel claims not being pursued in the subject divisional application being filed concurrently
3 herewith.
4

5 Respectfully submitted,

6
